

Liang Yating

Gender: Female Objective: Backend Engineer Location: Shanghai

Phone: 15868611839 Email: liangyating8188@qq.com

Education

2014.09 - 2018.06 Wuhan University Information Security (B.S.)

Courses: Compilers, Computer Organization, Distributed Systems, Data Structures and Algorithms, Machine Learning, Software Engineering

GPA 3.4/4.0, top 20% in major; merit scholarship

Summary

Backend engineer with several years of Java experience and an ~1-year career gap, self-studied and contributed to open source during the break.

Work Experience

2022.04 - Present Meituan Backend Engineer

- Optimized a file-sort slow SQL on a hot API, added a composite index via gh-ost online DDL, reducing P99 from 2600ms to 320ms.
- Investigated rising instance memory rss using GC logs, heap dump and arthas, found an unbounded cache and cut memory by 40%.
- Served 1520K requests per day while keeping core-path SLA above 99.9%.

Career gap: 2021.05 - 2022.04 (break for personal reasons; self-studied and contributed to open source)

2018.07 - 2021.05 Bilibili Backend Engineer

- Fixed a log-collection failure caused by agent backpressure, restoring stability after tuning batch and buffer settings.
- Tuned Redis caching for hot keys and cache breakdown with local cache and distributed locks, raising hit rate above 90%, significantly lowering maintenance cost.
- Rebuilt the config and template management service to support hot template reload without restart, cutting release time by 24%.

Projects

Enterprise Auth & Gateway Platform (Spring Cloud Gateway + OAuth2)

- Added circuit breaking to isolate faulty downstreams.
- Integrated OAuth2 and RBAC with multi-tenant isolation, with experience documented and shared internally.
- Shipped a unified SDK to lower integration cost across teams, reused across multiple business lines.
- Unified auth, rate limiting, gray routing and tracing as reusable platform capabilities.

High-Concurrency Flash-Sale & Inventory System (Java + Redis + RocketMQ)

- Pre-deducted inventory in Redis with async DB writes to absorb traffic spikes, ensuring online service stability.
- Stayed stable at 30000 QPS in load tests with error rate below 0.1%, improving end-to-end delivery quality.

- Designed distributed locks and token-bucket rate limiting to prevent oversell.
- Built circuit breaking and fallback for downstream failures, with experience documented and shared internally.

Distributed Payment & Settlement Platform (Spring Boot + MySQL + Kafka + Redis)

- Applied idempotency and eventual consistency to avoid duplicate charges on retry, and related standards were adopted by the team.
- Recorded an audit trace id for every payment state transition for compliance, recognized by stakeholders and peers.
- Implemented daily reconciliation across payment gateway, ledger and settlement files with auto-correction.
- Used sharding and read-write splitting to keep single-table rows within tens of millions, improving end-to-end delivery quality.

Highlights

- Drove a focused effort on Git collaboration and code review, reducing related issues by about 24%
- Led a major technical effort involving root-cause analysis and postmortems, staying stable at 30000 QPS peak
- Owned core modules that steadily served 1520K daily visits with 99.9%+ availability
- Built a reusable methodology and docs around MySQL indexing and slow-query tuning, adopted by several teams
- Continuously optimized project management and planning, cutting key-path latency from 2600ms to 320ms

Skills

Core skills: Java, Docker and containerization, Kafka/RocketMQ messaging

Proficient in: JVM tuning and troubleshooting, MySQL indexing and slow-query tuning, Backend

Familiar with: MySQL, Redis caching and distributed locks, Spring, Distributed transactions and consistency

Self Evaluation

- Stays calm under pressure and recovers services quickly during high-concurrency incidents
- Solid engineering fundamentals and strong troubleshooting skills, able to own a module end to end
