

Feng Ting

Gender: Female Objective: Senior Backend Engineer Location: Wuhan

Phone: 19685487099 Email: fengting6875@foxmail.com GitHub: <https://github.com/fengting116>

Education

2010.09 - 2014.06 Zhejiang University Computer Science and Technology (B.S.)

Courses: Distributed Systems, Computer Organization, Design Patterns, Software Engineering, Database Systems, Machine Learning

GPA 3.4/4.0, top 30% in major; merit scholarship

Summary

Seven years of backend experience focused on payment/transaction systems, distributed architecture, high concurrency and production incident response.

Work Experience

2017.07 - Present NIO Senior Backend Engineer

- Investigated rising instance memory rss using GC logs, heap dump and arthas, found an unbounded cache and cut memory by 46%, reused across multiple business lines.
- Fixed a log-collection failure caused by agent backpressure, restoring stability after tuning batch and buffer settings, improving end-to-end delivery quality.
- Designed a Kafka-based async transaction pipeline with idempotency keys, retry queues and dead-letter handling, sustaining 20000 QPS at peak.
- Served 6460K requests per day while keeping core-path SLA above 99.9%.
- Led a production incident review with root-cause analysis and drove an alert-tiering and on-call rotation mechanism, supporting rapid business growth.

2014.07 - 2017.06 Lalamove Backend Engineer

- Optimized a file-sort slow SQL on a hot API, added a composite index via gh-ost online DDL, reducing P99 from 1200ms to 380ms, reused across multiple business lines.
- Built service observability covering API latency, error rate, JVM GC, thread pools and consumer backlog with Prometheus and Grafana.
- Rebuilt the config and template management service to support hot template reload without restart, cutting release time by 24%, and key metrics improved steadily.
- Tuned Redis caching for hot keys and cache breakdown with local cache and distributed locks, raising hit rate above 90%, supporting rapid business growth.

Projects

High-Concurrency Flash-Sale & Inventory System (Java + Redis + RocketMQ)

- Stayed stable at 20000 QPS in load tests with error rate below 0.1%.
- Built circuit breaking and fallback for downstream failures.
- Designed distributed locks and token-bucket rate limiting to prevent oversell, improving end-to-end delivery quality.
- Pre-deducted inventory in Redis with async DB writes to absorb traffic spikes, and key metrics improved

steadily.

Distributed Payment & Settlement Platform (Spring Boot + MySQL + Kafka + Redis)

- Used sharding and read-write splitting to keep single-table rows within tens of millions.
- Applied idempotency and eventual consistency to avoid duplicate charges on retry.
- Implemented daily reconciliation across payment gateway, ledger and settlement files with auto-correction, improving end-to-end delivery quality.
- Recorded an audit trace id for every payment state transition for compliance.

Enterprise Auth & Gateway Platform (Spring Cloud Gateway + OAuth2)

- Unified auth, rate limiting, gray routing and tracing as reusable platform capabilities.
- Shipped a unified SDK to lower integration cost across teams, significantly lowering maintenance cost.
- Added circuit breaking to isolate faulty downstreams.
- Integrated OAuth2 and RBAC with multi-tenant isolation.

Highlights

- Work around JVM tuning and troubleshooting delivered about 46% efficiency gains and was reused across the team
- Established metrics and reviews around Distributed transactions and consistency to keep improving delivery quality
- Led a major technical effort involving requirement analysis and documentation, staying stable at 20000 QPS peak
- Built a reusable methodology and docs around design patterns and refactoring, adopted by several teams
- Drove a focused effort on Docker and containerization, reducing related issues by about 24%

Skills

Core skills: Distributed transactions and consistency, Kafka/RocketMQ messaging, Java, MySQL, JVM tuning and troubleshooting

Proficient in: MySQL indexing and slow-query tuning, Microservices, Observability, Redis caching and distributed locks, High Concurrency

Familiar with: Kafka, Redis, JVM, Spring Boot, Docker and containerization, SQL Optimization

Self Evaluation

- Business-minded, good at balancing technical design against delivery timelines
- Solid engineering fundamentals and strong troubleshooting skills, able to own a module end to end
